Adaptive Signal Processing in Wireless Communications (Adaptation in Wireless Communications)

Mohamed Ibnkahla

Adaptive techniques play a key role in modern wireless communication systems. The concept of adaptation is emphasized in the *Adaptation in Wireless Communications Series* through a unified framework across all layers of the wireless protocol stack ranging from the physical layer to the application layer, and from cellular systems to next-generation wireless networks. This specific volume, **Adaptive Signal Processing in Wireless Communications** is devoted to adaptation in the physical layer. It gives an in-depth survey of adaptive signal processing techniques used in current and future generations of wireless communication systems. Featuring the work of leading international experts, it covers adaptive channel modeling, identification and equalization, adaptive modulation and coding, adaptive multiple-input-multiple-output (MIMO) systems, and cooperative diversity. It also addresses other important aspects of adaptation in wireless communications such as hardware implementation, reconfigurable processing, and cognitive radio.

A second volume in the series, *Adaptation and Cross-layer Design in Wireless Networks*(cat no.46039) is devoted to adaptation in the data link, network, and application layers.
